Page 9: Forum Popup and Search Refinement

The profile and main explore webpage are the core pages that our site works around and therefore will shape how the rest of our site looks and behaves. With this in mind, we decided to stick to a familiar page layout that is common on most sites. This includes but is not limited to:  the search bar in the top right, a drop-down menu for search filters in the top right, the platform logo in the top left that also acts as a home button on other pages, the navigation bar on the left side of the screen with clickable icons to redirect the user around the site, and the placement of the main focused content in the center with relevant content surrounding it.

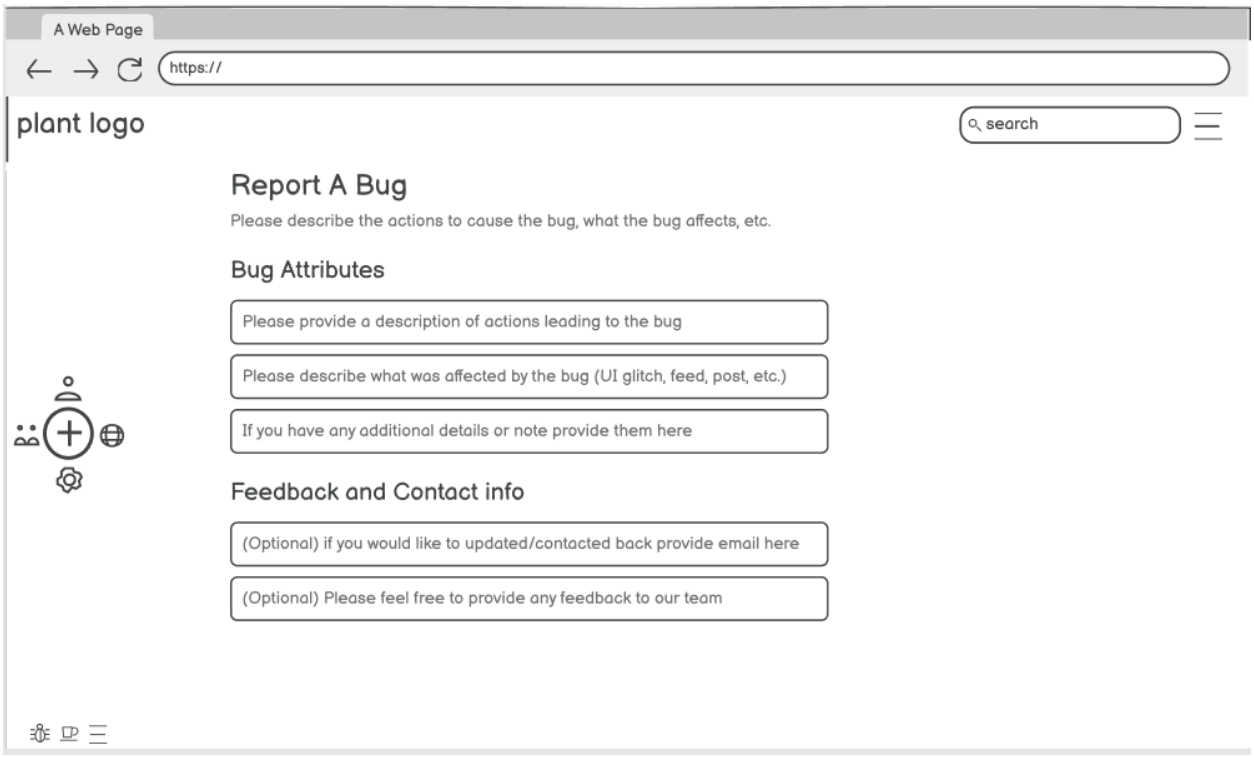

Choosing this familiar, simple-to-follow design allows anyone interacting with the site to intuitively find what they are looking for. Additionally, all users benefit from the access to quick links provided by the navigation bar as well as the feed filters. To accommodate investors' interests, we placed ad space around the main feed content allowing the advertisements to be seen by users without hindering the flow of the site. Administrators and users are able to click on the icon of a user's profile to view their profile page allowing for convenient navigation as well as developing natural connections between users.

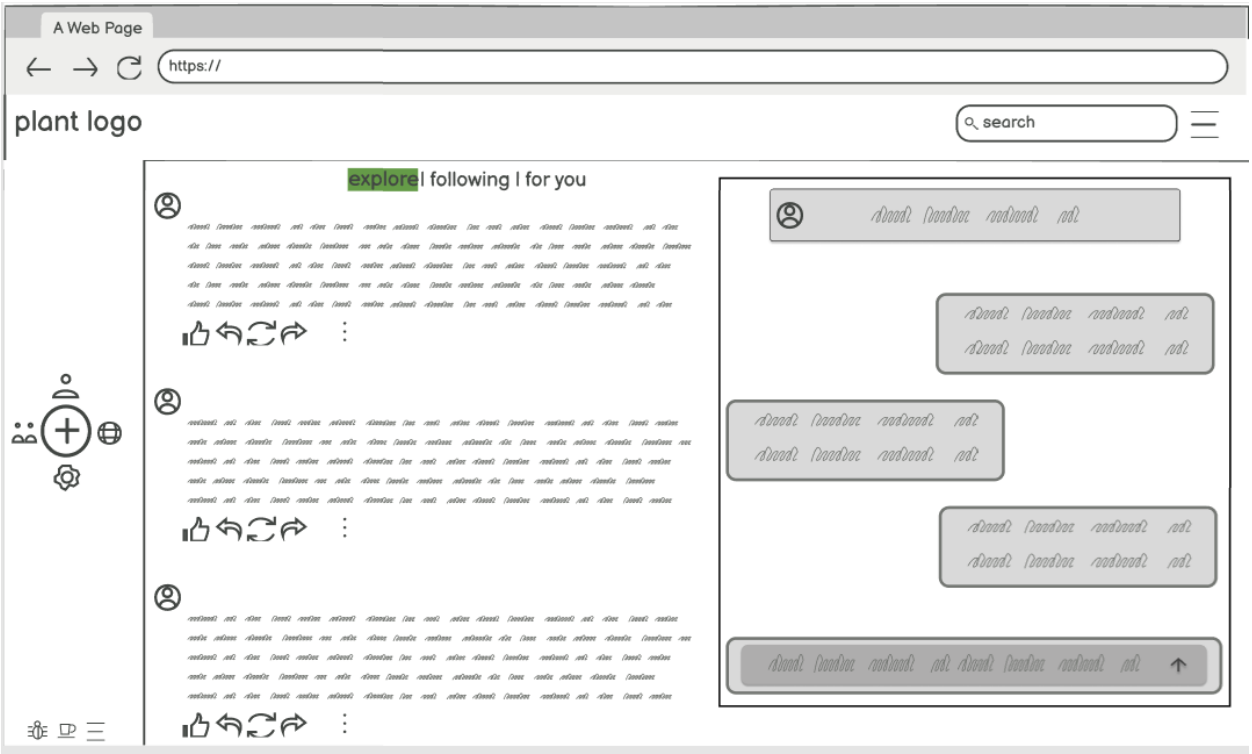

The login and Chat page follow the same design template created with our main home page and profile pages. The main difference comes in our login page where we opted to remove the side navigation bar and search bar. This prevents conflicts from happening, for example, if a user was to attempt to login, then click the search bar or quick link the system would not know to user a guest account or incomplete credentials from the attempted sign in. Additionally, the chat page's message bar, feed of chats, and chat title bar provide a familiar feel for users interacting with it.

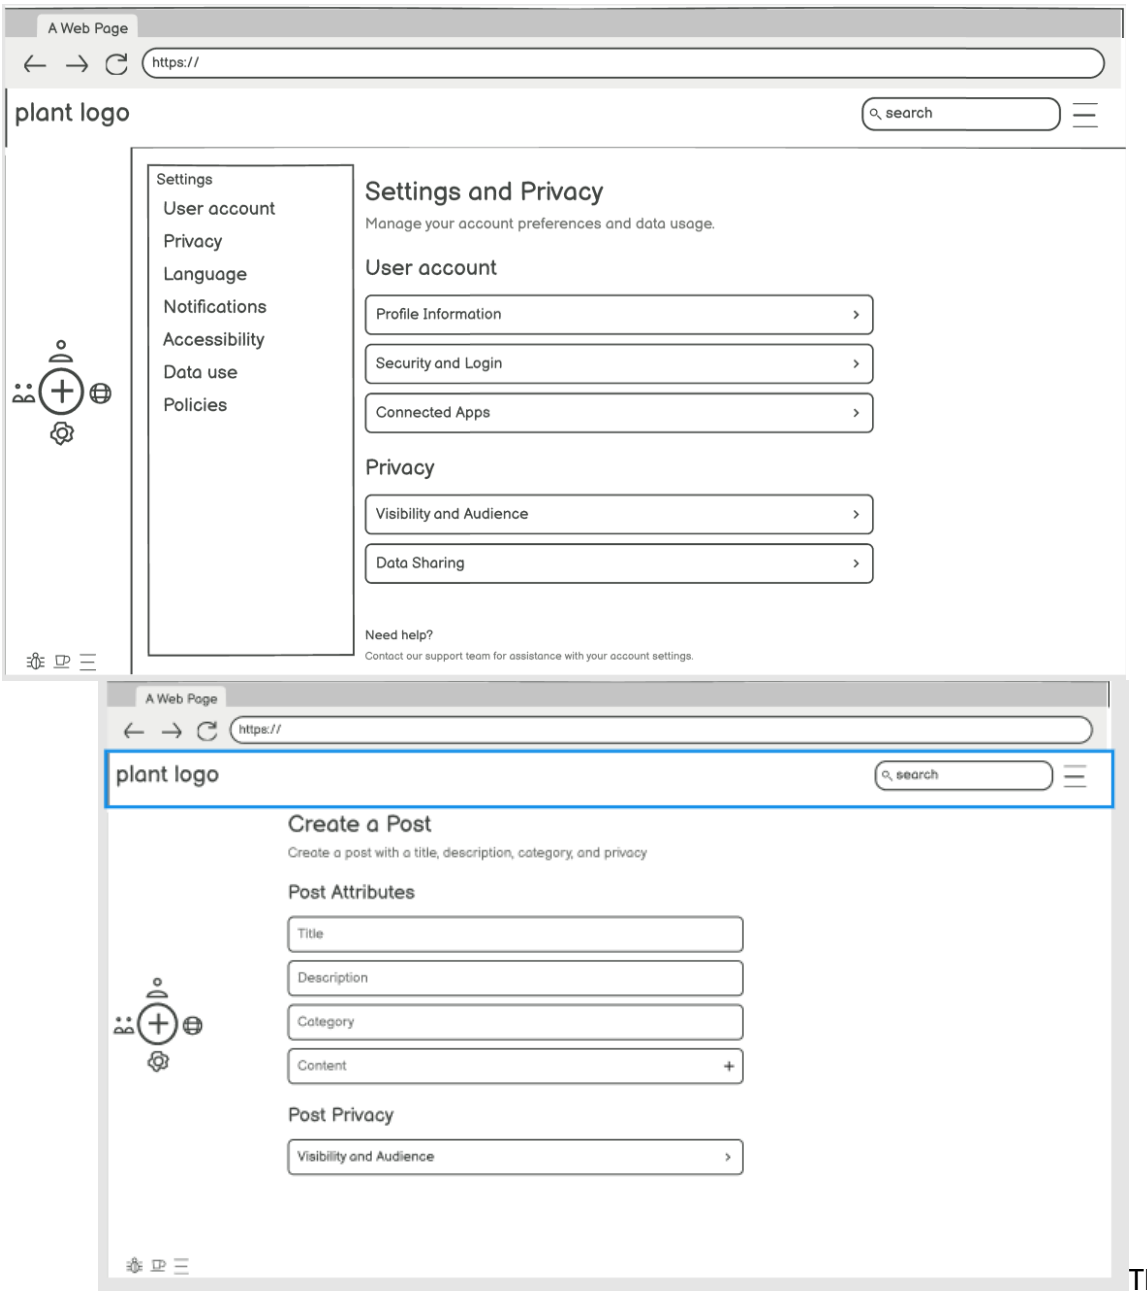

These design choices benefit our users by providing an easy-to-use user interface and the ability to comfortably connect with other users inside the plant platform. This is

also beneficial for our stakeholders and business users as it provides users more reason to stay in the app and makes networking with others easier.

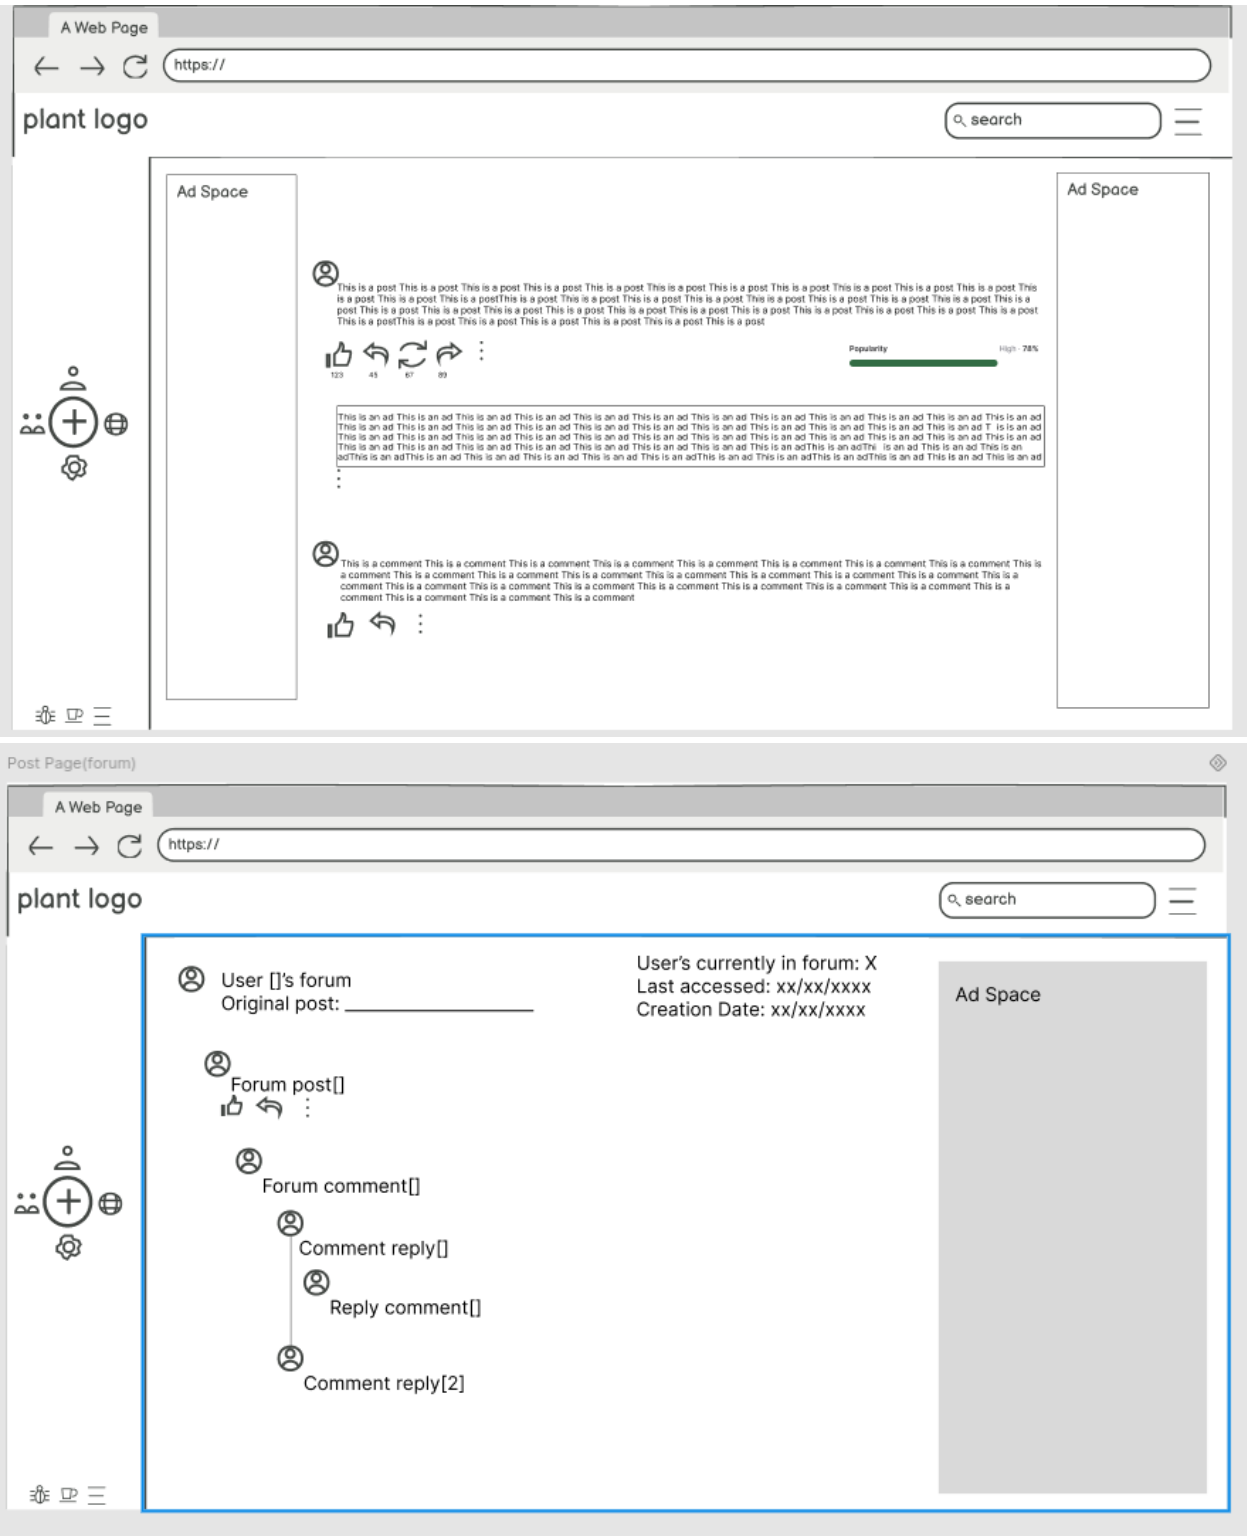

The support and bug reporting pages allow developers to gather feedback from users to make improvements or fix unknown bugs. The reporting page has separate fields for users to provide as much information as they want as well as the option for additional contact information. The support page is designed as a chat interface alongside the explore feed, so users can reference posts if needed. These pages are crucial in gathering feedback and ensuring user satisfaction.

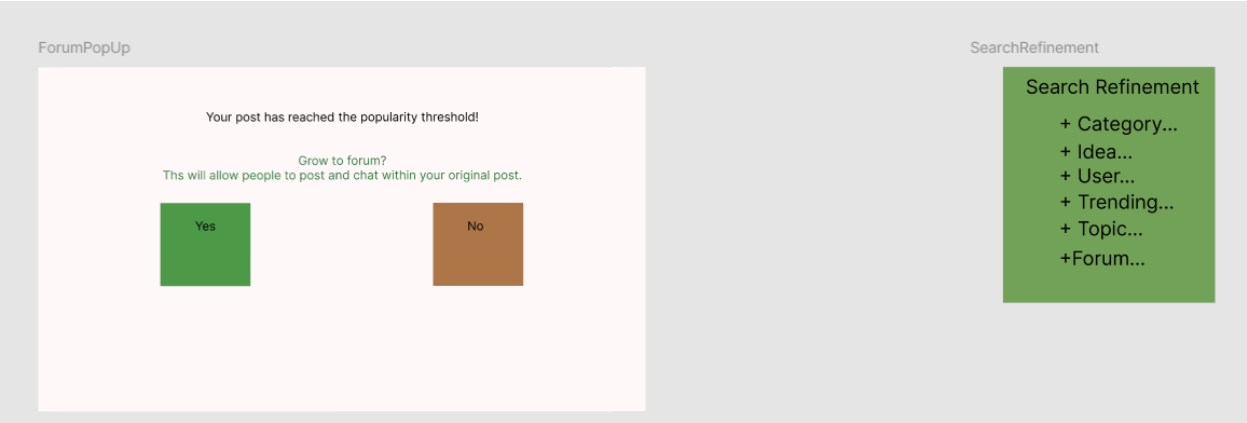

The settings and create-a-post page allow users to customize their experience and express themselves on Plant. The create-a-post page provides fields for all necessary fields to create a post ensuring that no fields are null in the database. Additionally, each post has additional privacy settings allowing users to make post only visible to people in their friends list. The settings page is designed with quick links so users can quickly jump to the settings they want to edit.

The Post page and forum page are the pages that users will mostly be interacting with. Therefore, these pages are styled matching the design template from the explore feed to keep a uniform look between pages. When a post advances to a forum, the pages design

remains the same but with fewer ads and more room for content interaction as well as additional information about the forum.

The post progression pop-up and the search refinement pages are styled as pop-up that would overlay on other pages. The pop-ups provide users with additional options such as upgrading their post and choosing which filters to apply to their search.
